INTRODUCTION

These appliance have been optimized to operate with the **R-407C** coolant which contains no chlorine and has no effect on the ozone layer.

BS split systems are easy to use both connected to a system of air distribution.

Split-systems include an exclusive microprocessor control system with automatic programs and infrared remote control units.

1. Advantages

- A small wall-mounted infrared receiver located where desired allows selection of all the available air conditioning functions using the remote control.
- The low height of the **BS** indoor units, (300 mm) facilitates installation in a double ceiling.
- The fan motors of the **BS** systems have three speeds to allow accurate output adjustment according to pressure losses in the ducts. In automatic mode, the system adjusts automatically to requirements at all times.

2. Refrigerant line

- The indoor and outdoor units are equipped with flare couplings allowing the use of flares refrigerant lines (refrigerant grade copper pipe).
- The **GCN** outdoor units are equipped with service valves.
- The refrigerant piping lenght is 50 m maximum.

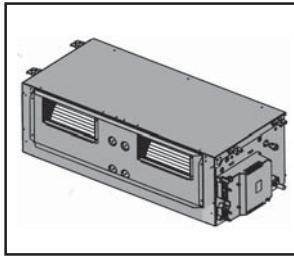

3. Description

- The indoor unit is designed for installation in a double ceiling supported by four anchor points used to attachment and leveling.
- The indoor units are supplied with a dry nitrogen charge at a pressure of 8 bars.
- Install the unit on the ground or against a wall using suitable supports, according to availabilities. The outdoor units are supplied with refrigerant charge.
- The outdoor units are equipped with SCROLL compressor.

4. Maintenance

- The trap door at the bottom facilitates internal access.
- The terminal box on the side is readily accessible from the bottom.

Consult the corresponding instructions and follow the recommendations when carrying out any work

**BS**

OPERATING LIMITS

The **BS/GCN** air conditioners alone and with heat pump operate normally within the following limits :

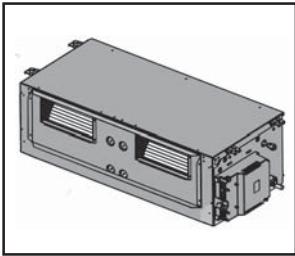

Cooling operation		
Exchanger air inlet temperature		
	°C BS	°C BH
Indoor unit (1)		
Minimum	21	15
Maximum	32	23
Outdoor unit		
Minimum	21	-
Maximum	46	-

For models with heat pump, the heating operating limits are :

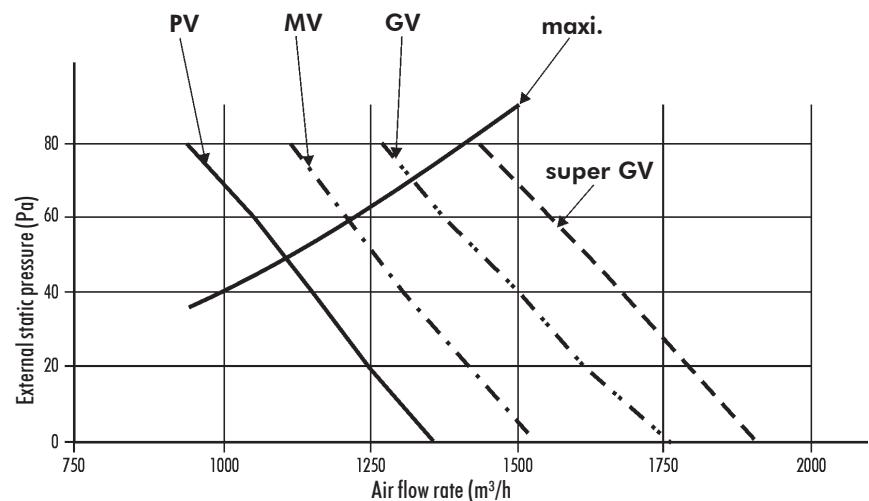

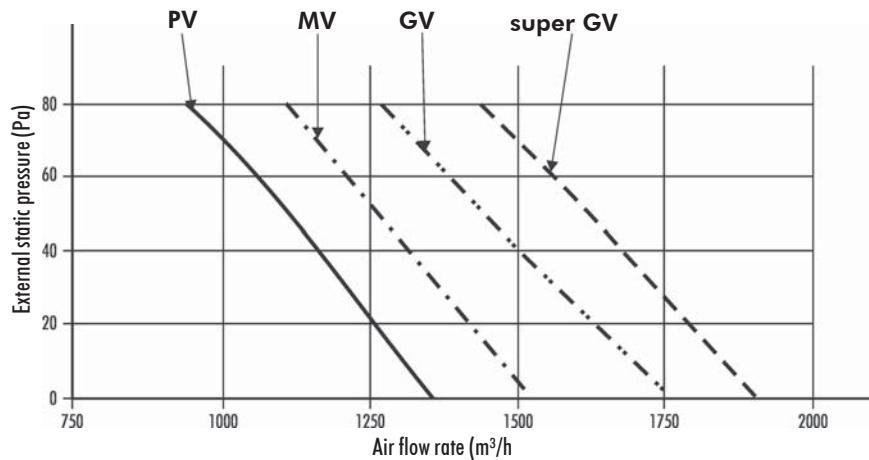

Heating operation		
Exchanger air inlet temperature		
	°C BS	°C BH
Indoor unit (1)		
Maximum	27	20
Outdoor unit		
Minimum	-9	-10
Maximum	24	18

NOTES :

(1) Other conditions with the same enthalpies are equivalent.

AERAULIC CHARACTERISTICS BS 36

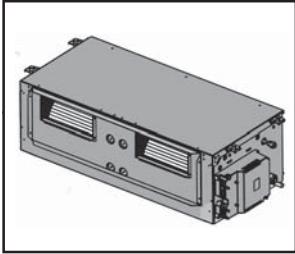

The values in the graphs correspond to :

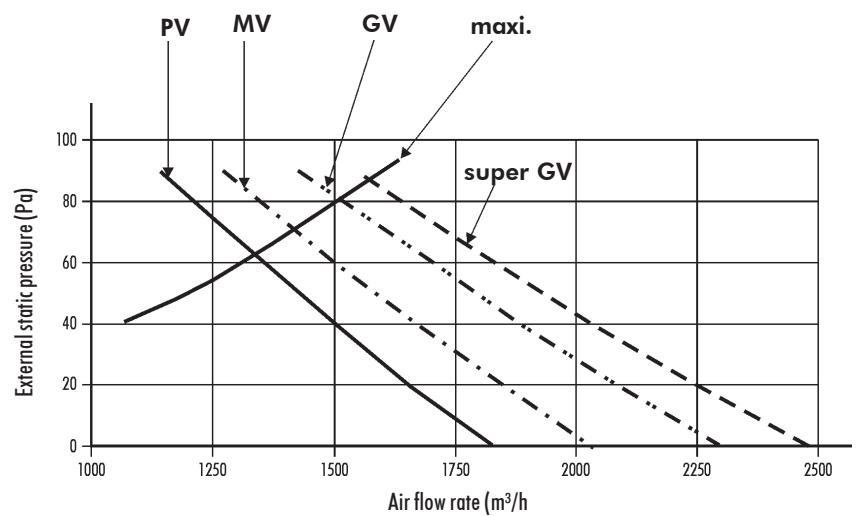

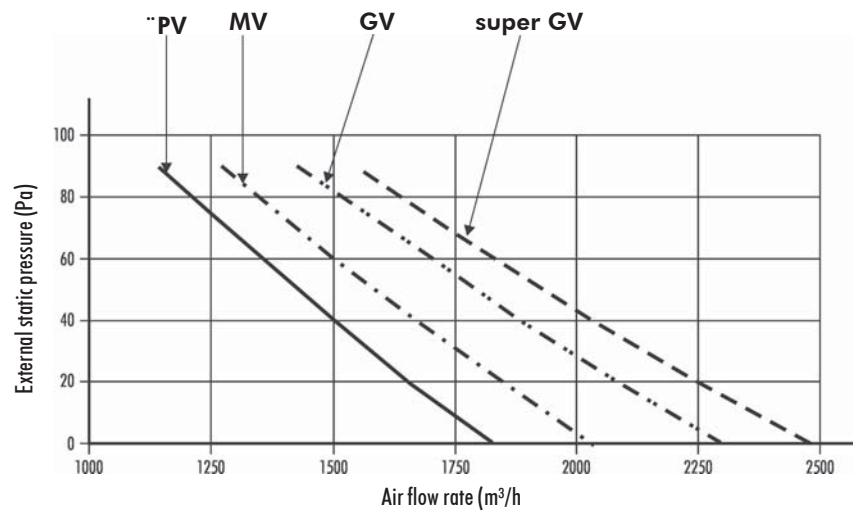

- Fan running at maximum speed.
- Battery dry and air filter clean.
- Power supply voltage 220 /230 V, 50 Hz.

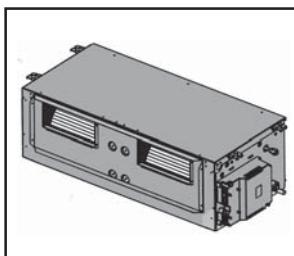

When designing the system, it is recommended to avoid air flow rates greater than 110 percent above the nominal air flow rate to avoid the entrainment of condensation droplets through the ducts.

Air flow rates less than 80 percent of the nominal air flow rate substantially affect the efficiency of the unit.

AERAULIC CHARACTERISTICS BS 43

BS

INSTALLATION

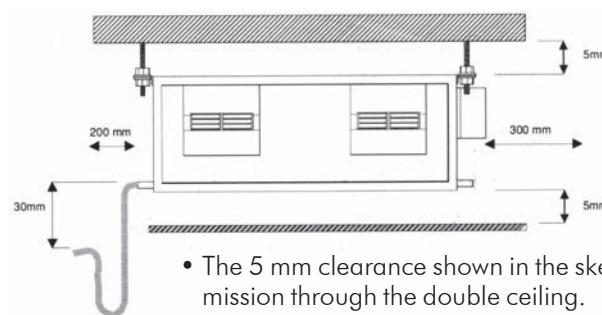

LOCATION OF THE INDOOR UNIT

CAUTION :

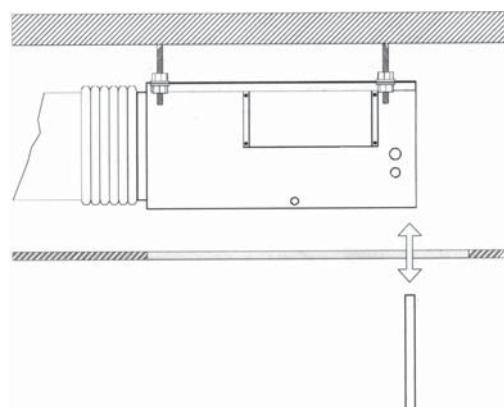

The indoor units are supplied with a dry nitrogen charge at a pressure of 8 bars.

- Installation of the indoor unit : only horizontal
- The indoor unit is designed for installation in a double ceiling supported by four anchor points used to attachment and leveling.
- The tubing between the indoor and outdoor units routed through a 60-mm wall opening. Connect both sections, taking the shortest, most direct route.
- Install away from smoke and dust that could foul the suction filter, decrease the equipment performance and affect the quality of the conditioned air.

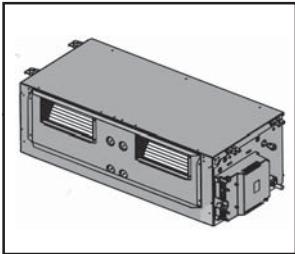

- The 5 mm clearance shown in the sketch prevents noise transmission through the double ceiling.
- The siphon shown, minimum 30 mm, on the condensate line guarantees condensate drainage during operation of the internal fan.(equipment not supplied).
If prevented by insufficient height, provide a special pump on the equipment panel.(equipment not supplied).

It is recommended to provide a flexible coupling between the supply duct and the indoor unit to prevent noise from being transmitted in the air processed (accessory not supplied).

Nota :

If the indoor unit is installed in a region where the relative humidity is high, provide additional insulation on the appliance to prevent risks of condensation spots.

INSTALLATION

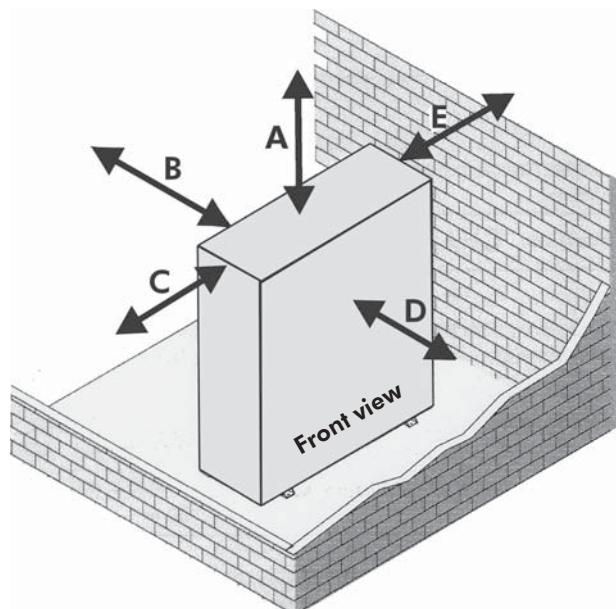

LOCATION OF THE OUTDOOR UNIT

CAUTION :

The outdoor units are supplied with refrigerant charge.

- The outdoor unit must be installed **outdoors in a location** allowing free air flow through the unit and access for periodic maintenance.
- Install the unit on the ground or against a wall using suitable supports, according to availabilities.
- In all cases, comply with the minimum clearance specified for the model used.
- For Heatpump models, if the outdoor temperature is likely to fall below +0°C, provide a system to prevent the condensates from freezing (e.g. heating cord)

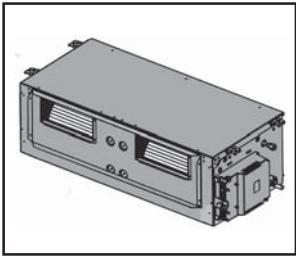

NOTES :

(1) With lateral air intake.

Keep free of any obstacles that could impede free air flow through the exchanger.

- 18 CLR key: Clears timer settings
- 19 LOCK key

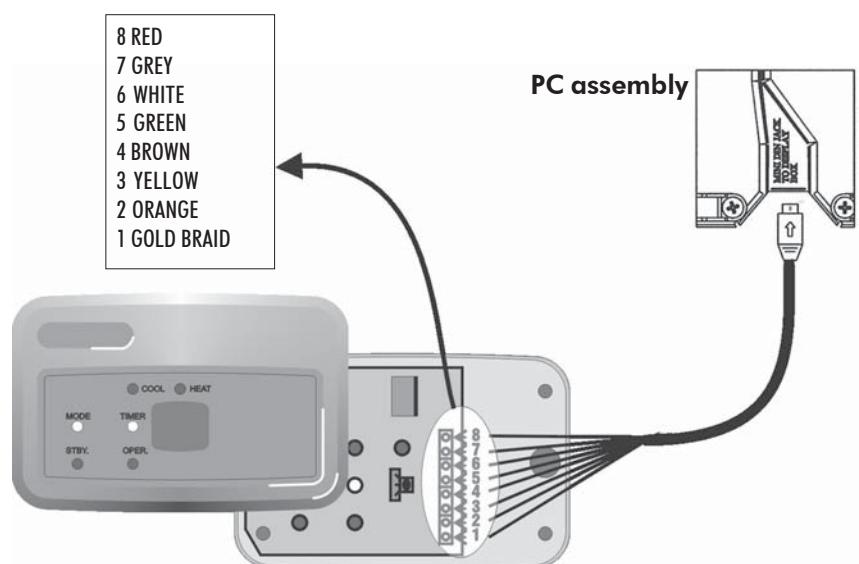

INFRARED RECEIVER INTERCONNECTION

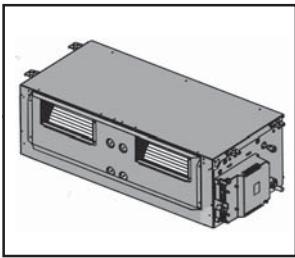

**Control panel/infrared receiver
interconnection**

- A 7 m shielded cable with connectors at both ends is provided with the equipment for interconnecting the control panel and infrared receiver.
- In case of difficulties with the connector cut it off the cable and wire the cable directly on the infrared receiver terminal board.

- In this case, follow the color codes shown on the terminal board corresponding to the 7 cable conductors plus the bonding braid, to be connected to the last terminal, marked Gd.
- To guarantee satisfactory connection, fit the cable ends with terminals for a 0.25 mm² size.
